ABSTRACT

GigShield AI – Smart Income Protection for Delivery Workers : (SURAKSHA)

SURAKSHA is a **Web** designed to protect **gig delivery workers from income loss caused by unexpected disruptions such as heavy rain, extreme heat, air pollution, or government restrictions. Many delivery workers depend completely on daily deliveries** to earn money, and when these disruptions occur they are unable to work and lose their income for that day. The goal of SURAKSHA is to provide a **smart and automated income protection system** that ensures workers receive **financial support during disruptions**.

The platform uses **real-time data** from **external APIs** such as **weather APIs**, **pollution data**, and **government alerts** to monitor environmental conditions. Workers can register on the **SURAKSHA platform** through a **web application or mobile app** and subscribe to a **low-cost weekly protection plan**. The system continuously monitors disruption conditions and uses **parametric triggers** to detect risk situations. When predefined thresholds are reached, the system **automatically triggers a compensation payout** using a **digital payment API integration**.

For example, if a delivery partner normally earns **₹700 per day** and **heavy rainfall exceeds a defined threshold**, deliveries in that area may stop. SURAKSHA detects this event using the **weather API**, activates the **automatic claim system**, and sends an **instant payout** to the worker's account. This **removes manual claim processes** and ensures **fast financial assistance** when workers cannot perform deliveries.

The SURAKSHA platform creates a **digital safety net for the gig economy** by combining **real-time monitoring**, **API integration**, **automated claim processing**, and **instant digital payments**. This solution can support delivery workers from **food delivery and e-commerce platforms** by ensuring that temporary disruptions do not completely stop their income.
